

HR Database – Setup Guide

SQL for Data Science · Medium dataset · SQL Server / SSMS

What's inside

Table	Rows	Key columns
DEPARTMENTS	15	dept_id (PK), dept_name, location
JOBS	20	job_id (PK), job_title, min_salary
EMPLOYEES	10,000	emp_id (PK), dept_id (FK), job_id (FK), salary, hire_date
PROJECTS	75	project_id (PK, varchar), dept_id (FK), budget
ASSIGNMENTS	2,500	emp_id+project_id (composite PK), hours

How to load it (SSMS)

1. Open SQL Server Management Studio and connect to your server instance.
2. Create or select a database (e.g. `CREATE DATABASE HR;` then `USE HR;`).
3. Open `HR_Database_Setup.sql`, then **Execute (F5)**. It drops any old tables, creates all five, and inserts every row in batches.
4. Run the validation queries at the bottom of the script to confirm the counts.
5. Alternatively, import the five CSV files via **Tasks > Import Flat File** if you prefer.

Validated figures (whole table)

`COUNT(*)` = 10,000 · `SUM(salary)` = 972,181,000 · `MIN` = 45,000 · `MAX` = 170,000 · `AVG` = 97,218.1

Canonical rows preserved

Employees 101–108 (Ananya, Rahul, Priya, Vikram, Sara, Imran, Neha, Arjun), departments 1–4 (Engineering/Bangalore, Sales/Mumbai, Support/Pune, Management/Delhi), jobs 1–4, and projects P1–P4 (Apollo, Orbit, Helpdesk, Falcon) keep their exact original IDs and values, so every lesson and slide built on the small dataset still validates against this larger one.
